

FixMaadi 24/7 Cloud Deployment Guide

This guide details how to deploy **FixMaadi** to a free cloud server so it runs **24 hours a day, 7 days a week**, completely independent of your laptop.

Option 1: Free 1-Click Deployment on Render.com (Recommended)

[Render.com](https://render.com) offers free 24/7 cloud server hosting for web applications.

Steps:

1. Upload Project to GitHub: Push the code from

`/Users/vinodchinnannavar/.gemini/antigravity/scratch/fixmaadi-bot` to a private or public GitHub repository.

2. Connect to Render:

- Go to [Render.com](https://render.com) and create a free account.
- Click **New + → Web Service**.
- Connect your GitHub repository.

3. Deploy:

- Select **Docker** as the Environment.
- Click **Create Web Service**.
- Render will build the container using our included `Dockerfile` and start the server automatically!

4. Link WhatsApp One Time:

- Once deployed, Render will give you a public URL (e.g. `https://fixmaadi-bot.onrender.com`).
- Open that URL in your browser to view the **FixMaadi Control Panel**.
- Scan the QR code with WhatsApp on your phone.
- Done! Your phone is now paired to the cloud server, and your bot will answer customer messages 24/7 even if your laptop is closed.

Option 2: Production Scaling with Meta WhatsApp Cloud API

When FixMaadi scales past the pilot phase (1,000+ daily orders), our Tech & Infrastructure Department will migrate the bot to the **Official Meta WhatsApp Cloud API**:

- **Zero QR Scanning:** Uses official phone number verification via Meta Developer Portal.
- **Infinite Concurrency:** Can handle 10,000+ messages per minute without rate limits.
- **Official Blue Checkmark Verification:** Gives FixMaadi official Meta verified business status.
- **Direct Webhook:** Integrates directly into cloud databases (Firebase / AWS DynamoDB).

Summary of Completed Deployment Assets Created:

-  `Dockerfile` (scratch/fixmaadi-bot/Dockerfile)
-  `render.yaml` (scratch/fixmaadi-bot/render.yaml)
-  `server.js` (scratch/fixmaadi-bot/server.js)
