

Urban Company Clone Implementation Plan

The goal is to build a clone of the Urban Company application. Urban Company is a complex marketplace connecting customers with home service professionals. Building a full clone is a significant undertaking, so this plan outlines a phased approach to building a Minimum Viable Product (MVP).

User Review Required

[!WARNING] Building a full clone of Urban Company is a very large project. We will start by focusing on a Minimum Viable Product (MVP) that covers the core user flow: browsing services and booking an appointment. Please review the proposed tech stack and scope below.

Open Questions

[!IMPORTANT] To proceed effectively, please clarify the following:

1. **Target Platform:** Do you want to build a Web App or a Mobile App? I strongly recommend starting with a Web App (using Next.js or Vite) to quickly establish the foundation with a premium UI.
2. **Tech Stack Preferences:** Are you okay with using React/Next.js for the frontend and Firebase (Authentication, Firestore) for the backend? This stack allows for rapid, robust development.
3. **Design Aesthetic:** We will aim for a premium, modern design with smooth animations and high-quality UI. Are there any specific brand colors or styles you have in mind?
4. **Scope Priority:** Should we focus strictly on the customer-facing app first, or do you also need the professional/provider side built simultaneously?

Proposed Changes

We propose building a web application with the following core MVP features initially:

Phase 1: Customer Application (MVP)

- **Authentication:** User sign up, login, and profile management.
- **Home/Discovery:** Browse service categories (e.g., Cleaning, Repair, Beauty).
- **Service Details:** View specific service offerings, pricing, and details.
- **Booking Flow:** Select a service, pick a date and time slot, and confirm the booking.
- **Bookings Dashboard:** View upcoming and past service appointments.

Phase 2: Professional (Provider) Application (Future)

- Provider onboarding and profile management.
- Dashboard to view and accept/reject booking requests.
- Schedule and earnings management.

Proposed Tech Stack (Web)

- **Frontend:** Next.js or Vite (React), using Vanilla CSS for rich, custom styling and animations.
- **Backend/Database:** Firebase (Authentication, Firestore Database).
- **Hosting:** Firebase Hosting / App Hosting.

Verification Plan

Automated Tests

- Basic testing of core logic and routing.

Manual Verification

- Manually verify the end-to-end customer journey: Account creation -> Browsing services -> Booking a service -> Verifying the booking exists in the dashboard.
